In its series of public lectures, the German Institute for Japanese Studies will present on

Thursday, 22 September 2005

Makoto Atoh
Professor, Waseda University

Lowest-low Fertility in Japan: Causes, Policy Responses and Related Value Change

Japanese fertility (measured by TFR) has continued to decline, below replacement level, for the last thirty years and reached 1.29 in 2003. With Southern and Eastern European countries and Asian NIES, Japan became a member of the so-called “lowest-low fertility countries”, which were defined by a German demographer, Dr. Hans-Peter Kohler, as those with TFR below 1.30. The social and economic as well as demographic implications of such low fertility are comprehensive, far-reaching and ominous. In my lecture, both demographic and social and economic causes of fertility decline in Japan will be discussed in comparative perspectives. I also trace policy responses to such declining fertility by Japanese Government for the last fifteen years beginning with “1.57 shock” and evaluate them in comparative perspectives. Lastly, some value issues related to lowest-low fertility situation in Japan will be raised.

Makoto Atoh (Ph.D.) was until March 2005 Director-General of the National Institute of Population and Social Security Research. As such he has directed numerous studies on Japan's population development. He is President of the Population Association of Japan and professor of sociology and demography at Waseda University.

The lecture will be given in English. It will take place on Thursday, 22 September 2005 at 6.30 p.m. at the DIJ. Admission is free, please register with Ms. Dinkel at the DIJ.
